CROSS-REFERENCES TO RELATED APPLICATIONS

[0001] This application claims priority to U.S. Provisional Patent Application No. 60/457,848, filed March 24, 2003, the teachings of which are hereby incorporated by
5 reference in their entirety.

BACKGROUND OF THE INVENTION

[0002] Cysteine proteases represent an enzymatic class of proteins that catalyze the hydrolysis of peptide bonds by a nucleophilic sulfhydryl group of a cysteine residue in the active site of the enzyme. Several normal and disease processes in mammals have been
10 associated with cysteine protease activity and include, but are not limited to: osteoporosis, osteoarthritis (Inui, T., O. Ishibashi, *J Biol Chem* **1997**, 272(13), 8109-12; Saftig, P., E. Hunziker, *et al.*, *Adv Exp Med Biol* **2000**+ADs **2000**, 477, 293-303; Saftig, P., E. Hunziker, *et al.*, *Proc Natl Acad Sci U S A* **1998**, 95(23), 13453-8), periodontal diseases, Paget's disease, atherosclerosis (Jormsjo, S., D. M. Wuttge, *et al.*, *Am J Pathol* **2002** 161(3), 939-45),
15 multiple sclerosis (Beck, H., G. Schwarz, *et al.*, *Eur J Immunol* **2001**, 31(12), 3726-36), rheumatoid arthritis (Nakagawa, T. Y., W. H. Brissette, *et al.*, *Immunity* **1999**, 10(2), 207-17; Hou, W. S., Z. Li, *et al.*, *Am J Pathol* **2001**, 159(6), 2167-77), juvenile onset diabetes, lupus, asthma (Cimerman, N., P. M. Brguljan, *et al.*, *Pflugers Arch* **2001**, 442(6 Suppl 1), R204-6), tissue rejection, Alzheimer's disease (Lemere, C. A., J. S. Munger, *et al.*, *Am J Pathol* **1995**,
20 146(4), 848-60), Parkinson's disease (Liu, Y., L. Fallon, *et al.*, *Cell* **2002**, 111(2), 209-18), neuronal degeneration, shock (Jaeschke, H., M. A. Fisher, *et al.*, *J Immunol* **1998**, 160(7), 3480-6), cancer (Fernandez, P. L., X. Farre, *et al.*, *Int J Cancer* **2001**, 95(1), 51-5), malaria (Malhotra, P., P. V. Dasaradhi, *et al.*, *Mol Microbiol* **2002**, 45(5), 1245-54), Chagas (Eakin, A. E., A. A. Mills, *et al.*, *J Biol Chem* **1992**, 267(11), 7411-20), leishmaniasis, shistosomiasis,
25 and African trypanosomiasis (Caffrey, C. R., S. Scory, *et al.*, *Curr Drug Targets* **2000**, 1(2), 155-62; Lalmanach, G., A. Boulange, *et al.*, *Biol Chem* **2002**, 383(5), 739-49).

[0003] Cathepsins are a subclass of cysteine protease that belong to the enzyme classification EC 3.4.22 (Barrett, A. J., N. D. Rawlings, *et al.*, *Handbook of proteolytic enzymes*. London, Academic Press). Cathepsins play a major role in lysosomal, endosomal,
30 and extracellular protein degradation and have thus been implicated in many disease

processes. For example, Cathepsin B [EC 3.4.22.1] has been postulated to play a role in tumor metastasis (Berquin, I. M. and B. F. Sloane *Adv Exp Med Biol* 1996, 389, 281-94).

[0004] Cathepsin S [EC 3.4.22.27] is largely expressed in professional antigen presenting cells such as macrophages and dendritic cells. Cathepsin S has been shown to be required for proper MHC class II antigen presentation (Shi, G. P., J. A. Villadangos, *et al.*, *Immunity* 1999, 10(2) 197-206). As a result of its non-redundant role in MHC class II antigen presentation, cathepsin S has been associated with inflammation, arthritis, and atherosclerosis. The selective expression of cathepsin K [EC 3.4.22.38] in osteoclasts coupled with the ability of cathepsin K to degrade type I collagen suggests that it plays a role in normal and pathogenic bone remodeling (Bromme, D., K. Okamoto, *et al.*, *J Biol Chem* 1996, 271(4), 2126-32). There is a need in the art for compounds and methods that selectively inhibit specific cysteine proteases for treating several pathogenic disorders in mammals. The present invention satisfies these and other needs.

BRIEF SUMMARY OF THE INVENTION

[0005] The present invention provides compounds, compositions and methods for the selective inhibition of cathepsin S. The compounds of the present invention are selective for cathepsin S in the presence of other cathepsin isozymes (*e.g.* cathepsin K). The present invention also provides methods for treating a disease state in a subject by selectively inhibiting cathepsin S in the presence of other cathepsin isozymes.

[0031] Amino can be optionally substituted by, e.g., alkyl.

[0032] Carbocyclic represents a saturated or partially unsaturated cyclic hydrocarbon with 5 to 7 ring members, wherein 1 to 2 ring members can optionally be replaced with one of the following groups: -O-, -S-, -S(=O)-, -S(=O)₂- and -NR-, wherein R is a radical of the present invention.

[0033] Heterocyclyl represents a saturated cyclic hydrocarbon containing one or more, preferably 1 or 2 heteroatoms selected from O, N or S, and from 3 to 10, preferably 5 to 8, ring atoms; for example, tetrahydrofuranyl, tetrahydrothienyl, tetrahydropyrrolyl, piperidinyl, piperazinyl or morpholino; all of which can be optionally substituted, for instance as hereinbefore defined for aryl.

[0034] Pharmaceutically acceptable salts of the acidic compounds of the present invention are salts formed with bases, namely cationic salts such as alkali and alkaline earth metal salts, such as sodium, lithium, potassium, calcium, magnesium, as well as ammonium salts, such as ammonium, trimethyl-ammonium, diethylammonium, and tris-(hydroxymethyl)-methyl-ammonium salts.

[0035] Similarly acid addition salts, such as of mineral acids, organic carboxylic and organic sulfonic acids, e.g., hydrochloric acid, methanesulfonic acid, maleic acid, are also possible provided a basic group, such as pyridyl, constitutes part of the structure.

[0036] "Treat", "treating" and "treatment" refer to a method of alleviating or abating a disease and/or its attendant symptoms.

[0037] "Inhibition", "inhibits" and "inhibitor" refer to a compound that prohibits, or a method of prohibiting, a specific action or function.

[0038] "Inhibition constant", K_i , is the dissociation constant of the enzyme-inhibitor complex, or the reciprocal of the binding affinity of the inhibitor to the enzyme. For classical inhibition the value of K_i is much greater than the enzyme concentration and the K_i can be measured by monitoring the rate of reaction for a competitive substrate at multiple inhibitor concentrations. The inhibited rates are then fit by nonlinear regression to the following equation:

$$v_i/v_o = \frac{K_m + [S]}{K_m (1 + [I]/K_i) + [S]}$$

where v_o is the initial rate of substrate processing in the absence of inhibitor, v_i is the initial rate of substrate processing at a concentration $[I]$ of inhibitor, K_m is the steady state Michaelis constant (Fersht, A. Structure and Mechanism in Protein Science. New York, W.H. Freeman and Company, 1999), and $[S]$ is the concentration of competitive substrate.

[0039] The assumption being made for the classical inhibition described above is that the free inhibitor concentration is equal to the total inhibitor concentration. For inhibitors that have K_i 's that are approximately equal to the enzyme concentration $[E]$, the assumption that the free inhibitor concentration is equal to the total inhibitor concentration is no longer valid and an alternative equation has to be fit for determination of the apparent inhibition constant, K_i^{app} using described methods (Kuzmic, P., K. C. Elrod, *et al.*, *Anal Biochem* **2000**, 286(1), 45-50):

$$v_i/v_o = \frac{[E] - [I] - K_i^{app} + \text{SQRT} \left(([E] - [I] - K_i^{app})^2 + 4[E] K_i^{app} \right)}{2[E]}$$

The inhibition constant, K_i , can be determined from the apparent inhibition constant, K_i^{app} , for competitive inhibitors by using the following relationship:

$$K_i = \frac{K_i^{app}}{1 + [S]/K_m}$$

[0040] "Therapeutically effective amount" refers to that amount of the compound being administered sufficient to prevent development of or alleviate to some extent one or more of the symptoms of the condition or disorder being treated.

[0041] "Composition" as used herein is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts. By "pharmaceutically acceptable" it is meant the carrier, diluent or excipient must be compatible with the other ingredients of the Formulation and deleterious to the recipient thereof.

[0042] "Subject" refers to animals such as mammals, including, but not limited to, primates (e.g., humans), cows, sheep, goats, horses, dogs, cats, rabbits, rats, mice and the like. In certain aspects, the subject is a human.

[0043] "Prodrug" refers to the compounds of this invention which may be modified by appending appropriate functionalities to enhance selective biological properties. Such modifications are known in the art and include those which increase penetration into a given biological compartment (e.g. central nervous system), increase oral bioavailability, increase solubility to allow administration by injection, alter metabolism and alter rate and/or route of excretion. In addition, the compounds may be altered to prodrug form such that the desired compound is created in the body of the patient as the result of the action of metabolic or other biochemical processes on the prodrug.

[0044] It will be apparent to one skilled in the art that certain compounds of this invention may exist in tautomeric forms or hydrated forms, all such forms of the compounds being within the scope of the invention.

[0045] Structures depicted herein are also meant to include compounds that differ only in the presence of isotopically enriched atoms. For example, compounds having the present structures except for the replacement of a hydrogen by a deuterium are expressly included in the present invention.

II. General

[0046] Cathepsin S is a cysteine protease that has been associated with several normal and disease processes in mammals. Specifically, cathepsin S has been directly associated with inflammation, arthritis, and atherosclerosis, as a result of its role in MHC class II antigen presentation. In a preferred aspect, the present invention provides compounds that inhibit the activity of cathepsin S. The present invention also provides methods for treating several disease states in mammals by inhibiting the activity of cathepsin S. In a more preferred aspect, the compounds of the present invention selectively inhibit cathepsin S in the presence of at least one cathepsin isozyme (*e.g.* cathepsin K).

III. Compounds

A. Preparation of Compounds

[0047] In the following schemes, several methods of preparing the compounds of the present invention are illustrative. One of skill in the art will appreciate that these methods are representative, and in no way inclusive of all methods for preparing the compounds of the present invention. The radicals in the schemes are as described in Formula I.

[0048] Compounds of the present invention can be made via the route shown in Scheme 1.

Scheme 1

- a) i) $\text{NH}_2\text{CH}_2\text{CH}_2\text{NR}^9\text{Ar}$, AcOH, DMF, rt;
 ii) $\text{NaHB}(\text{OAc})_3$, DMF;
 b) i) $\text{FmocHNQCO}_2\text{H}$, HOBt, DIC, DMF, rt;
 ii) 20% piperidine in DMF;
 c) i) $\text{R}^1\text{CO}_2\text{H}$, HOBt, DIC, DMF, rt;
 ii) TFA/DCM/ H_2O .

[0049] Polystyrene aldehyde (PAL) resin was reductively aminated with a monoaryl diamine ($\text{NH}_2\text{CH}_2\text{CH}_2\text{NR}^9\text{Ar}$) which was made as per literature protocol [Altman, E.; Renaud, J.; Green, J.; Farley, D.; Cutting, B; Jahnke W. *J. Med Chem.* **2002**, *45*, 2352-54 and references cited therein] to obtain the resin **1-A** (Scheme 1). This material was acylated with an N-protected amino acid using standard conditions [as described in A. R. Chamberlin, *Chem. Rev.* **1997**, *97*, 2243-66; M. Bodanszky et al. *The Practice of Peptide Synthesis 2nd*, Springer-Verlag, 1984] and the product was then deprotected with piperidine to furnish **1-B**. After acylation with $\text{R}^1\text{CO}_2\text{H}$ under standard amide coupling condition, cleavage from resin using TFA furnished **1-C**. In scheme 1, Q is defined as $-\text{CR}^2\text{R}^3-$.

[0050] Compounds of the present invention can be made via the route shown in Scheme 2.

Scheme 2

- a) 1 M NaOH; [EDC, HOBT, DCM or DMF, then ethanolamine (5 eq.) in DMF or DCM] or [PyBOP-Cl (1.0 eq.), TEA (1.0 eq.), NH₂CHR⁵R⁶CH₂OH in DCM followed by TEA in DCM];
 b) i) Dess-Martin periodinane, DCM; ii) NHR⁹Ar, NaCNBH₃, AcOH, MeOH

[0051] A conjugate 2-A (Scheme 2) was synthesized by Schotten-Bauman reaction of an acyl chloride with the appropriate amino acid in 1 M NaOH. The intermediate 2-B was synthesized by acylating NH₂CR⁵R⁶CH₂OH with 2-A using standard conditions. The alcohol 2-B was then oxidized. The resulting aldehyde was reacted with an aromatic amine in methanol in the presence of acetic acid and NaCNBH₃ to give product 2-C.

[0052] The arylaminoethylamines 3-A (Scheme 3) used in the present invention can be prepared by a decarboxylative ring opening of oxazolidin-2-one with an aromatic amine as described in E. Altman et al *J. Med Chem.* 2002, 45, 2352-54 and references cited therein.

Scheme 3

[0053] Mono-arylated diamine intermediates used in the present invention can be made via the route described in Scheme 4.

Scheme 4

a) Pd₂dba₃, BINAP, *t*BuOK, NH₂CR⁵R⁶CR⁷R⁸NH₂, dioxane, 100°C.

[0054] An aryl bromide (or iodide) was reacted with a diamine using a Pd-BINAP catalyst and *t*BuOK as base (Frost, C.G.; Mendonça, P. *Tetrahedron:Asymmetry* **1999**, *10*, 1831-4 and references cited therein). Intermediate 4-A (scheme 4) can be coupled to an amino acid conjugate under standard condition to yield 4-B.

[0055] Another synthetic route to compounds of the present invention of general formula (I), in which R⁵ and/or R⁶ ≠ H, is described in Scheme 5.

Scheme 5

a) [BH₃·THF, THF 0 °C] or (i)TEA, *i*-butyl-chloroformate, THF, 0 °C; ii) NaBH₄, H₂O, 0 °C to RT];

b) i) Dess-Martin periodinane, DCM; ii) NHR⁹Ar, NaCNBH₃, AcOH, MeOH;

c) i) removal of PG; ii) amide coupling condition.

[0056] A N-protected amino acid can be reduced using either the BH₃ method or NaBH₄ reduction of the corresponding mixed anhydride [see R. C. Larock *A guide to functional group preparations* pp.548-552, Wiley-VCH, **1989**] to obtain 5-A (Scheme 5). One can then oxidize the alcohol to the aldehyde and reductively aminate the resulting aldehyde with an amine to afford 5-B. This intermediate can then be deprotected using the appropriate reagents for the PG, such as TFA for Boc, and the resulting amine can be acylated to give access to 5-C.

[0057] To access compounds of the present invention with cyclic diamines incorporated, the protocol illustrated in Scheme 6 can be used.

Scheme 6

- 5 a) Ar-Br, Pd₂dba₃, 2-(di-*t*-Buphosphino)biphenyl, *t*BuOK, dioxane, heat;
 - b) 6 M HCl, reflux;
 - c) Diphenylphosphoryl azide, Et₃N, *t*BuOH, heat;
 - d) i) HCl, MeOH; ii) standard amide coupling condition.
- 10 [0058] An amide derivative of a cyclic amino acid can be N-arylated under Pd catalysis to afford **6-A** (Scheme 6). This intermediate can then be hydrolyzed using strong acid such as 6 M HCl at elevated temperature for an extended period of time to furnish **6-B**. This acid can then be degraded *via* Curtius rearrangement using DPPA in an *t*-BuOH solvent to obtain the carbamate **6-C**. After the removal of the Boc protecting group, the intermediate can be
- 15 coupled with an amino acid conjugate under standard condition to afford **6-D**.

[0077] Compounds of the present invention are either obtained in the free form, or as a salt thereof if salt forming groups are present, or as esters if ester forming groups are present.

10 [0078] Compounds of the present invention that have acidic groups can be converted into salts with pharmaceutically acceptable bases, e.g., an aqueous alkali metal hydroxide, advantageously in the presence of an ethereal or alcoholic solvent, such as a lower alkanol. Resulting salts can be converted into the free compounds, e.g., by treatment with acids. These, or other salts can also be used for purification of the compounds obtained. Ammonium salts are obtained by reaction with the appropriate amine, e.g., diethylamine, and
15 the like.

[0079] In certain aspects, compounds of the present invention having basic groups can be converted into acid addition salts, especially pharmaceutically acceptable salts. These are formed, for example, with inorganic acids, such as mineral acids, for example, sulfuric acid, a phosphoric or hydrohalic acid, or with organic carboxylic acids, such as (C₁-C₄) alkane
20 carboxylic acids which, for example, are unsubstituted or substituted by halogen, for example, acetic acid, such as saturated or unsaturated dicarboxylic acids, for example, oxalic, succinic, maleic or fumaric acid, such as hydroxycarboxylic acids, for example, glycolic, lactic, malic, tartaric or citric acid, such as amino acids, for example, aspartic or glutamic acid, or with organic sulfonic acids, such as (C₁-C₄)-alkylsulfonic acids (for example,
25 methanesulfonic acid) or arylsulfonic acids which are unsubstituted or substituted (for example, by halogen). Preferred are salts formed with hydrochloric acid, methanesulfonic acid and maleic acid.

[0080] In view of the close relationship between the free compounds and the compounds in the form of their salts or esters, whenever a compound is referred to in this context, a
30 corresponding salt or ester is also intended, provided such is possible or appropriate under the circumstances.

[0081] The compounds, including their salts, can also be obtained in the form of their hydrates, or include other solvents used for their crystallization.

[0082] The compounds of the present invention that comprise free hydroxyl groups may also exist in the form of pharmaceutically acceptable, physiologically cleavable esters, and as
5 such are included within the scope of the invention. Such pharmaceutically acceptable esters are preferably prodrug ester derivatives, such being convertible by solvolysis or cleavage under physiological conditions to the corresponding compounds of the present invention which comprise free hydroxyl groups. Suitable pharmaceutically acceptable prodrug esters are those derived from a carboxylic acid, a carbonic acid monoester or a carbamic acid,

[0083] As will be apparent to one of skill in the art, certain compounds of the present invention possess asymmetric carbon atoms (optical centers) or double bonds; the racemates, diastereomers, enantiomers, geometric isomers and individual isomers are all intended to be
15 encompassed within the scope of the present invention.

In a more preferred aspect, compounds of the present invention that selectively
30 inhibit cathepsin S in the presence of cathepsin isozyme, have a cathepsin isozyme inhibition constant at least 100 times greater than their cathepsin S inhibition constant. In a most

preferred aspect, compounds of the present invention that selectively inhibit cathepsin S in the presence of cathepsin isozyme, have a cathepsin isozyme inhibition constant at least 1000 times greater than their cathepsin S inhibition constant.

A. Compounds

[0111] **General Procedure.** All solvents stated as anhydrous were purchased that way from the manufacturer and used as received. All other purchased reagents were used as received. Unless otherwise stated, all reactions were carried out under a positive pressure of
25 nitrogen. Silica gel chromatography was performed using pre-packed cartridges and an instrument for making a linear solvent gradient along with automated fraction collection. ^1H NMR spectral data were reported as follows: chemical shift on the δ scale (using residual protio solvent as the internal standard), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet), integration and coupling constant in hertz. ^{13}C spectra were recorded
30 as APT experiments and were reported in ppm with residual solvent for internal standard.

[0112] **Preparation 1.** Synthesis of 2,2-dimethyl-5-fluoroindoline.

Step A: A solution of N-Boc-4-fluoroaniline (9.02 g, 42.7 mmol) in THF (112 mL) was cooled to -60 °C using a cryocool instrument. The solution was treated with 1.7 M *t*-BuLi in pentane (63 mL, 106.7 mmol) dropwise. After the first equivalent of base was consumed, a yellow solution formed. The reaction was allowed to warm to -20 °C and was stirred at that temperature for 2.5 hours. The reaction was then treated with a solution of methallyl bromide (5.67 g, 42.7 mmol) in THF (35 mL) dropwise and stirred for an additional 1.5 hours at -20 °C. The reaction was then quenched by addition of water. After coming to room temperature, the reaction was treated with ethyl acetate and extracted with water and brine, dried over MgSO₄ and filtered. The solvent was then removed and the residue was purified on silica gel using a gradient of 0-25% ethyl acetate in hexane to afford 11.3 g (80% yield) of [4-Fluoro-2-(2-methyl-allyl)-phenyl]-carbamic acid tert-butyl ester as a white solid; ¹H NMR (CDCl₃, 400 MHz) δ 1.50 (s, 9H), 1.72 (s, 3H), 3.28 (s, 2H), 4.71 (s, 1H), 4.92 (s, 1H), 6.32-6.50 (m, 1H), 6.86 (dd, 1H, *J*₁ = 3.0, *J*₂ = 9.1), 6.93 (ddd, 1H, *J*₁ = 3.0, *J*₂ = 8.5, *J*₃ = 11.5), 7.65-7.82 (m, 1H); HPLC-MS calcd. for C₁₅H₂₀FNO₂ (M + H⁺-*t*Bu) 210.1, found 210.3.

Step B: A sample of [4-Fluoro-2-(2-methyl-allyl)-phenyl]-carbamic acid tert-butyl ester (1.10 g, 4.14 mmol) was treated with anisole (5 mL), dichloromethane (5 mL) and trifluoroacetic acid (5 mL) and stirred for 4 hours. The solvent was removed and the reaction was transferred to a microwave reaction vial using methanesulfonic acid (3 mL). The reaction was heated to 170 °C for 10 minutes. The reaction was cooled to room temperature and quenched into excess stirring 1 M NaOH. The aqueous phase was extracted twice with ethyl acetate and the combined organics were dried over MgSO₄ and filtered. The resulting oil was purified on silica gel using a gradient of 0-70% *t*-butyl ethyl ether and hexane to afford 450 mg (66% yield) of 2,2-dimethyl-5-fluoroindoline; ¹H NMR (CDCl₃, 400 MHz) δ 1.08 (s, 6H), 2.58 (s, 2H), 6.24 (dd, 1H, *J*₁ = 4.4, *J*₂ = 8.4), 6.43-6.48 (m, 1H), 6.53-6.56 (m, 1H); HPLC-MS calcd. for C₁₀H₁₂FN (M + H⁺) 166.1, found 166.4.

[0113] Preparation 2. Synthesis of 3,3-dimethyl-5-fluoroindoline.

According to the procedure described in S. Coulton *et al.* WO9925709 with the following modifications. N-(4-Fluoro-phenyl)-N-(2-methyl-allyl)-acetamide (5 grams, 24.12 mmol) was added to a microwave tube with aluminum trichloride (7 grams, 52.4 mmol). The tube was capped and heated to 150°C for 20 minutes under microwave. The slurry was worked up with water and ethyl acetate, the organic layer was extracted with 3 washes of saturated sodium bicarbonate solution and the organic layer was dried over magnesium sulfate. The solution was then filtered and rotary evaporated to yield pure 1-(5-Fluoro-3,3-dimethyl-2,3-

dihydro-indol-1-yl)-ethanone in quantitative yield. This was converted to the free indoline by suspending the entire 5 grams of product in 20 mL of 6 M HCl and heating in a microwave to 200° C for 10 minutes. The resulting 5-Fluoro-3,3-dimethyl-2,3-dihydro-1H-indole crystallized on cooling as the hydrochloride salt in quantitative yield. This material was
5 identical to the previously reported compound.

[0114] Preparation 3. Synthesis of (S)-[1-Cyclopropyl-2-(5-fluoro-3,3-dimethyl-2,3-dihydro-indol-1-yl)-ethyl]-carbamic acid benzyl ester.

Step A: (S)-cyclopropyl glycine was prepared according to a modified procedure from that reported in D. J. Bayston *et al.* US 6191306. A sample of (R)-phenethyl-(S)-cyclopropyl
10 glycine (16.8 g, 76.7 mmol) was treated with THF (200 mL), water (100 mL) and 10% Pd/C (4.76 g). To the stirring mixture was added formic acid (17 mL) and the reaction was stirred overnight. The catalyst was then removed by filtration through a pad of celite and the solvent was removed by rotary evaporation. The material was co-evaporated with methanol several times and dried under vacuum to afford 4.75 g (54% yield) of the desired material as a solid
15 which was used without further purification.

The material from the previous step (4.75 g, 41 mmol) was dissolved in 130 mL of 1 N NaOH and treated with benzyl chloroformate (5.92 g, 49.5 mmol) with vigorous stirring. The reaction was stirred overnight and then extracted with dichloromethane twice. The organics were discarded and the aqueous phase was acidified with conc. HCl and extracted with
20 dichloromethane three times. The combined organics were dried over MgSO₄ and the solvent was removed to afford 7.38 g (72% yield) of the (S)-benzyloxycarbonylamino-cyclopropyl-acetic acid as a white solid.

Step B: A solution of (S)-benzyloxycarbonylamino-cyclopropyl-acetic acid (3.2 g, 12.8 mmol) in THF (20 mL) was cooled in an ice/water bath and treated with a 1 M solution of
25 BH₃ in THF (16.7 mL, 16.7 mmol). The reaction was stirred for 4 hours and then treated with 1 M HCl until the bubbling ceased. The reaction was stirred overnight and the organic solvent was removed by rotary evaporation. The residue was treated with ethyl acetate and transferred to a separatory funnel. The aqueous phase was discarded and the organics were washed twice with 1 M NaOH, dried over MgSO₄ and the solvent was removed. The residue
30 was purified on silica gel using a gradient of 0-100% ethyl acetate in hexane to afford 1.5 g (50% yield) of (S)-(1-Cyclopropyl-2-hydroxy-ethyl)-carbamic acid benzyl ester as a white solid; ¹H NMR (CDCl₃, 400 MHz) δ 0.26-0.37 (m, 1H), 0.34-0.44 (m, 1H), 0.47-0.61 (m,

2H), 0.83-0.94 (m, 1H), 2.95-3.04 (m, 1H), 3.70 (dd, 1H, $J_1 = 5.8$, $J_2 = 11.1$), 3.79-3.88 (m, 1H), 5.00-5.12 (m, 1H), 5.10 (s, 2H), 7.29-7.31 (m, 5H); HPLC-MS calcd. for $C_{13}H_{17}NO_3$ ($M + H^+$) 236.1, found 236.3.

Step C: (S)-[1-Cyclopropyl-2-(5-fluoro-3,3-dimethyl-2,3-dihydro-indol-1-yl)-ethyl]-

- 5 carbamic acid benzyl ester was prepared in 67% yield an analogous manner to **example 22, step A** except that the alcohol from the previous step and 1 equivalent of 3,3-dimethyl-5-fluoroindoline (WO 9925709) were used as coupling partners; HPLC-MS calcd. for $C_{23}H_{27}FN_2O_2$ ($M + H^+$) 383.2, found 383.4.

- 10 **[0115] Preparation 4.** Synthesis of (S)-[1-Cyclopropyl-2-(5-fluoro-3,3-spirocyclopropyl-indol-1-yl)-ethyl]-carbamic acid benzyl ester.

[0117] Preparation 6. Synthesis of (S)-2-(4-Methoxy-phenylamino)-1-methyl ethyl amine.

15 **[0118] Step A:** Preparation of (S)-2-(tert-Butoxycarbonylamino)-propionaldehyde.

(S)-(-)-2-(tert-Butoxycarbonylamino)-1-propanol (523 mg, 2.98 mmol, 1.0 equiv.) was dissolved in 45 mL methylene chloride in a 100 mL r.b. flask with a magnetic stir bar. To this clear homogeneous solution, Dess-Martin periodinane (1.523 g, 3.591 mmol, 1.2 equiv.) was added in one part and the cloudy white reaction mixture was allowed to stir at room temperature for 2 h. Thin-layer chromatography monitored the reaction to completion. The reaction mixture was diluted with 100 mL ethyl acetate. Sodium bisulfite solution (2 M, 20 mL) was added to the reaction mixture and the organic layer was separated. The aqueous layer was washed with 3 × 30 mL EtOAc. The combined organic layers were washed with 50 mL 1 M NaOH, followed by saturated NaCl (30 mL) and dried over MgSO₄. Filtration and rotary evaporation produced the desired product as a yellow oil (475 mg, 92% yield, R_f = 0.63, 1:1 hexanes/ethyl acetate).

[0119] Step B: Preparation of [2-(4-methoxy-phenylamino)-(1S)-methyl-ethyl]-carbamic acid tert-butyl ester.

(S)-2-(tert-Butoxycarbonylamino)-propionaldehyde (473 mg, 2.74 mmol) and p-anisidine (1.031 g, 8.371 mmol, 3.0 equiv.) was dissolved in 45 mL of MeOH at 0 °C in a 100 mL r.b. flask with a magnetic stir bar. Optionally, acetic acid (469 µL, 8.21 mmol, 3.0 equiv.) can be

added via syringe to assist in the reaction. To the stirring dark colored solution was added sodium cyanoborohydride (326 mg, 5.82 mmol, 1.89 equiv.). Gas evolution and disappearance of color were observed. The reaction was allowed to slowly warm to room temperature with stirring over 30 minutes and the reaction was monitored by LC/MS. The resulting organics were washed with 50 mL saturated NaHCO₃, 40 mL saturated NaCl, and dried over MgSO₄. Evaporation of ethyl acetate provided 728 mg of a brown oil. Purification by automated ISCO chromatography provided a clear oil of [2-(4-methoxy-phenylamino)-(1S)-methyl-ethyl]-carbamic acid tert-butyl ester (583 mg, 2.079 mmol, 76% yield). HPLC-MS calcd. for C₁₅H₂₄N₂O₃ (M + H⁺) 281.2, found 281.5. ¹H NMR (CDCl₃, 400 MHz) δ 1.21 (d, 6H, *J* = 6.6 Hz), 1.47 (s, 9H), 3.05 (dd, 1H, *J* = 12.2, 7.3 Hz), 3.13 (dd, 1H, *J* = 12.2, 4.6 Hz), 3.76 (s, 3H), 3.93 (broad s, 1H), 4.62 (broad s, 1H), 6.60 (d, 2H, *J* = 6.8 Hz), 6.80 (2H, d, *J* = 6.8 Hz).

The reaction turns dark purple/black in color after 5 minutes. The reaction is allowed to stir at room temperature until the reaction is judged complete by HPLC/MS. The solvent is removed by evaporation and to provide 2-(4-Methoxy-phenylamino)-(1S)-methyl-ethyl-ammonium trifluoroacetate salt as a brown oil (394 mg, 1.34 mmol, 98% yield) and used directly in the next reaction. [0123] **Step B:** The product from **Step A** (400 mg, 1.00 mmol) was added to an ice cold solution of borane (1 M) in THF. The cooling bath was removed and the reaction was allowed to stir for 24 h at which point the excess reagent was quenched using 5% NaHSO₄. Step B: Preparation of (S)-N-[1-(2-Hydroxy-ethylcarbamoyl)-3-methyl-butyl]-3-methyl-benzamide. (S)-4-Methyl-2-(3-methyl-benzoylamino)-pentanoic acid (1 g, 4.0 mmol), ethanolamine (270 mg, 4.4 mmol) and HOBt (596 mg, 4.4 mmol) were treated with DCM (20
25 mL) followed by EDCI (845 mg, 4.4 mmol). The reaction was allowed to stir for 2 h and then purified directly by silica gel column chromatography using ethyl acetate and hexane to afford the product (350 mg, 30%) as a solid: ¹H NMR (CDCl₃, 400 MHz) δ 0.89-0.99 (m, 6H), 1.67-1.79 (m, 3H), 2.37 (s, 3H), 3.31-3.41 (m, 1H), 3.42-3.52 (m, 1H), 3.61 (dd, 1H, *J*₁ = 2.7, *J*₂ = 8.1), 7.24-7.34 (m, 2H), 7.43 (dd, 1H, *J*₁ = *J*₂ = 5.3), 7.57-7.63 (m, 2H); HPLC-

Step C: (S)-N-[1-(2-Hydroxy-ethylcarbamoyl)-3-methyl-butyl]-3-methyl-benzamide (803 mg, 2.75 mmol) was dissolved in DCM (10 mL) and treated with the Dess-Martin

periodinane (1.3 g, 5.4 mmol). The reaction was allowed to stir for 2 hours and then diluted with DCM and extracted with 1 M Na₂S₂O₃ solution (1×) and saturated aqueous NaHCO₃ solution (1×). The organics were dried and the solvent was removed. The resulting solid was partitioned into lots and used for several reductive aminations as described below:

- 5 A 100 mg (0.34 mmol) portion of the material prepared as above along with NaCNBH₃ (65 mg, 1.0 mmol) and 5-fluoroindoline (95 mg, 0.69 mmol) were dissolved in DMF (1 mL) and treated with acetic acid (112 mg, 1.9 mmol). Optionally, MeOH may be used as solvent in this reaction. The resulting solution was allowed to stand overnight at room temperature and diluted with ethyl acetate. The organic portion was extracted with aqueous NaHCO₃ solution
10 (1×), dried over MgSO₄ and evaporated. The resulting oil was purified over silica gel using ethyl acetate and hexane as the solvents to afford the title compound (60.7 mg, 43%) as an oil: ¹H NMR (CDCl₃, 400 MHz) δ 0.92-1.00 (m, 6H), 1.62-1.83 (m, 3H), 2.40 (s, 3H), 2.85-3.00 (m, 2H), 3.10-3.22 (m, 2H), 3.30-3.41 (m, 2H), 3.45-3.58 (m, 2H), 4.62-4.70 (m, 1H), 6.38 (dd, 1H, *J*₁ = 4.1, *J*₂ = 8.4), 6.53-6.61 (m, 1H), 6.63-6.75 (m, 2H), 6.77-6.83 (m, 1H), 7.27-

Step A: In a flame-dried flask, sodium *t*-butoxide (1.38 g, 14.4 mmol), BINAP (0.897 g, 1.44 mmol) and Pd₂dba₃ (0.443 g, 0.484 mmol) were treated with anhydrous dioxane (10 mL) followed by 4-bromoanisole (1.49 g, 7.99 mmol) and 1, 2-diaminopropane (0.671 g, 9.06 mmol). The flask was sealed with a 3-way stopper and immersed into a 90 °C pre-heated oil bath and allowed to stir overnight. The reaction flask was cooled to rt. Dioxane was removed prior to extraction. The concentrated mixture was diluted with ethyl acetate and extracted with water (2×). The organics were extracted with 1 M NaOH (2×) followed by 1 M HCl (2×). The aqueous layer was collected and treated with NaOH pellets until the pH was highly basic. The aqueous portion was once again extracted with ethyl acetate. The organics were collected, dried over MgSO₄ and concentrated. The resulting material was used for the next acylation step in the synthesis without purification.

Step B: The material from the Step A (117 mg, 0.650 mmol) was dissolved with DMF followed by the addition of (S)-4-Methyl-2-(3-methyl-benzoylamino)-pentanoic acid (128 mg, 0.510 mmol, prepared according to Example 3, Step A), HATU (277 mg, 0.73 mmol) and DIPEA (210 mg, 1.62 mmol). The reaction was allowed to stir at rt overnight. The mixture was diluted with ethyl acetate and extracted with water followed by 1 M HCl. The organics were collected, dried over MgSO₄ and concentrated. The final material was purified by reverse phase preparative HPLC using TFA as a modifier. The final compound is therefore a partial TFA salt and the properties are reported for the material as it appeared after solvent removal. The data are reported for the diastereomeric mixtures.

[0149] Example 22. *N*-{1-(S)-[2-(4-Methoxy-phenylamino)-1-(S)-methyl-ethylcarbamoyl]-3-methyl-butyl}-3-methyl-benzamide.

Step A: Preparation of (S)-2-(tert-Butoxycarbonyl-1-amino)-1-propionaldehyde.

(S)-(-)-2-(tert-Butoxycarbonyl-1-amino)-1-propanol (523 mg, 2.98 mmol, 1.0 equiv.) was dissolved in 45 mL methylene chloride in a 100 mL r.b. flask with a magnetic stir bar. To this clear homogeneous solution, Dess-Martin periodinane (1.523 g, 3.591, 1.2 equiv.) was added in one part and the cloudy white solution reaction was allowed to stir at room temperature for 2 h. Thin-layer chromatography monitored the reaction to completion. The reaction mixture

was diluted with 100 mL ethyl acetate. Sodium bisulfate solution (2 M, 20 mL) was added to the reaction mixture and the organic layer was separated. The aqueous layer was washed with 3 × 30 mL EtOAc. The combined organic layers were washed with 50 mL 1 M NaOH, followed by saturated NaCl (30 mL) and dried over MgSO₄. Filtration and rotary evaporation produced the desired product as a yellow oil (475 mg, 92% yield, R_f = 0.63, 1:1 hexanes/ethyl acetate).

Step B: Preparation of [2-(4-Methoxy-phenylamino)-(1S)-methyl-ethyl]-carbamic acid tert-butyl ester. (S)-2-(tert-Butoxycarbonyl-1-amino)-1-propionaldehyde (473 mg, 2.74 mmol) and p-anisidine (1.031 g, 8.371 mmol, 3.0 equiv.) was dissolved in 45 mL of MeOH at 0 °C in a 100 mL r.b. flask with a magnetic stir bar. Optionally, acetic acid (469 µL, 8.21 mmol, 3.0 equiv.) can be added via syringe to assist in the reaction. To the stirring dark colored solution was added sodium cyanoborohydride (326 mg, 5.82 mmol, 1.89 equiv.). Gas evolution and disappearance of color were observed. The reaction was allowed to slowly warm to room temperature with stirring over 30 minutes and the reaction was monitored by LC/MS. At the completion of the reaction, the mixture was quenched with 1 M NaOH, and extracted 3 × 50 mL ethyl acetate. The resulting organics were washed with 50 mL saturated NaHCO₃, 40 mL saturated NaCl, and dried over MgSO₄. Evaporation of ethyl acetate provided 728 mg of a brown oil. Purification by automated ISCO chromatography provided a clear oil of [2-(4-Methoxy-phenylamino)-(1S)-methyl-ethyl]-carbamic acid tert-butyl ester (583 mg, 2.079 mmol, 76% yield). The reaction turns dark purple/black in color after 5 minutes. The reaction is allowed to stir at room temperature until the reaction is judged complete by HPLC/MS. The solvent is removed by evaporation and to provide 2-(4-Methoxy-phenylamino)-(1S)-methyl-ethyl-ammonium; trifluoro-acetate salt as a brown oil (394 mg, 1.34 mmol, 98% yield) and used directly in the next reaction. [0160] **Example 34.** *N*-{1-(*S*)-[*trans*-2-(4-Methoxy-phenylamino)-cyclohexylcarbamoyl]-3-methyl-butyl}-3-methyl-benzamide. The title compound was prepared according to the procedures of Examples 20 and 21, except that *trans*-diaminocyclohexane was used in the Step A. The final material was purified by reverse phase preparative HPLC using TFA as a
15 modifier. The final compound is therefore a partial TFA salt and the properties are reported for the material as it appeared after solvent removal (20%): ¹H NMR (CDCl₃, 400 MHz) δ 0.85-1.05 (m, 6H), 1.05-1.41 (m, 3H), 1.43-1.51 (m, 1H), 1.60-1.96 (m, 7H), 2.32 (s, 3H), 3.81 (s, 3H), 3.70-3.95 (m, 2H), 4.24-4.33 (m, 1H), 6.88 (d, 1H, *J* = 8.6), 7.22-7.39 (m, 4H), 7.51-7.59 (m, 2H), 7.74-7.85 (m, 1H), 8.68-8.80 (m, 1H), 9.30-9.90 (m, 2H).

[0161] **Example 35.** *N*-{1-(*S*)-[1-(*R*)-Benzyloxymethyl-2-(4-methoxy-phenylamino)-ethylcarbamoyl]-3-methyl-butyl}-3-methyl-benzamide.

Step A: *N*-Boc-OBn-Serine (750 mg, 2.54 mmol), *p*-anisidine (344 mg, 2.79 mmol) and HOBt (377 mg, 2.79 mmol) were charged to a 50 mL roundbottom flask and treated with DCM (6 mL). The reaction was then treated with EDCI (535 mg, 2.79 mmol) and allowed to
25 stir for 2 hours. The reaction was then diluted with ethyl acetate and extracted twice with water, twice with 1 M HCl and twice with 1 M NaOH. The organics were then dried over MgSO₄ and the solvent was removed to afford 450 mg (44%) of a white solid: ¹H NMR (CDCl₃, 400 MHz) δ 1.49 (s, 9H), 3.63-3.72 (m, 1H), 3.81 (s, 3H), 4.00-4.08 (m, 1H), 4.47-4.50 (m, 1H), 4.55-4.70 (m, 2H), 5.45-5.60 (m, 1H), 6.87 (d, 2H, *J* = 8.8), 7.30-7.41 (m, 7H),
30 8.20-8.33 (m, 1H); HPLC-MS calcd. for C₂₂H₂₈N₂O₅ (M + H⁺) 401.2, found 401.4.

Step B: The product from **Step A** (400 mg, 1.00 mmol) was added to an ice cold solution of borane (1 M) in THF. The cooling bath was removed and the reaction was allowed to stir for

24 h at which point the excess reagent was quenched using 5% NaHSO₄. The reaction was diluted with ethyl acetate and extracted twice with 1 M NaOH. The organics were dried over MgSO₄ and the solvent was removed. The resulting residue contained material that was missing the Boc group and some material that still had it (by HPLC-MS). The oil was treated with MeOH (2mL) and 4 M HCl (2mL) and stirred for 3 hours. The solvent was then removed and the reaction was partitioned between ethyl acetate and 1 M NaOH. The aqueous phase was extracted twice more with ethyl acetate and the combined organics were dried over MgSO₄ and the solvent was removed. The residue was treated with (S)-4-Methyl-2-(3-methyl-benzoylamino)-pentanoic acid (249 mg, 1 mmol, obtained from Example 3, Step A), HOBt (148 mg, 1.1 mmol) and DCM (5 mL). The reaction was then treated with EDCI (211 mg, 1.1 mmol) and allowed to stir for 3 hours. The reaction was then diluted with ethyl acetate and extracted with 1 M NaOH twice. The combined organics were dried over MgSO₄ and the solvent was removed. The residue was purified by silica gel column chromatography using ethyl acetate and hexane as solvents to afford a white solid (100 mg, 19%). The material is most likely partially racemized at the leucine so the data are reported for the major species: ¹H NMR (CDCl₃, 400 MHz) δ 0.90-1.02 (m, 6H), 1.62-1.79 (m, 3H), 2.38 (s, 3H), 3.24-3.38 (m, 2H), 3.51 (dd, 1H, *J*₁ = *J*₂ = 5.3), 3.61-3.65 (m, 1H), 3.75 (s, 3H), 3.70-3.87 (m, 1H), 4.24-4.37 (m, 1H), 4.68-4.78 (m, 2H), 6.59 (d, 2H, *J*₁ = 8.5), 6.77 (d, 2H, *J*₁ = 8.4), 6.89 (d, 2H, *J*₁ = 8.0), 7.26-7.40 (m, 6H), 7.58-7.66 (m, 2H); HPLC-MS calcd. for C₃₁H₃₉N₃O₄ (M + H⁺) 518.3, found 518.3.

Following the procedures of Example 22, except using *N*-Boc-OBn-serinol, 5-fluoroindoline, (*L*)-4-fluorophenylalanine and anisoyl chloride as starting materials, the title compound was prepared. The chiral center on the 4-fluorophenylalanine partially racemized during the reaction and the data are reported for the major diastereomer (30% yield): ¹H NMR (CDCl₃, 400 MHz) δ 2.85-3.24 (m, 6H), 3.24-3.47 (m, 3H), 3.53-3.64 (m, 1H), 3.81 (s, 3H), 4.14-4.22 (m, 1H), 4.37-4.49 (m, 2H), 4.75 (dd, 1H, *J*₁ = 7.2, *J*₂ = 14.0), 6.08-6.17 (m, 1H), 6.38-6.43 (m, 1H), 6.67-6.86 (m, 2H), 6.85-6.95 (m, 2H), 7.00-7.06 (m, 1H), 7.14-7.33 (m, 11H); HPLC-MS calcd. for C₃₅H₃₅F₂N₃O₄ (M + H⁺) 600.3, found 600.5.

Step A: (*S*)-[1-Methyl-2-(4-trifluoromethoxy-phenylamino)-ethyl]-carbamic acid tert-butyl ester was produced as follows: S-N-Boc-Alinol (259 mg, 1.47 mmol) and Dess-Martin periodane (748 mg, 1.76 mmol) were dissolved in 25 mL of dry DCM and stirred for 1 hour. The resulting slurry was partitioned with $Na_2S_2O_3$ and sodium bicarbonate, washed with brine, dried over magnesium sulfate and dried down to a white solid. The resulting aldehyde was treated with a methanol solution of 4-trifluoromethoxyaniline (260 mg, 1.47 mmol),

NaCNBH₃ (179 mg, 2.94 mmol), and acetic acid (353 mg, 5.88 mmol) sequentially. The resulting solution was stirred for 1 hour, stripped to dryness, taken up in ethyl acetate and washed with sodium bicarbonate. The organic layer was then dried over magnesium sulfate, stripped down and purified by column chromatography, yield 418 mg (85%).

5 **Step B:** S-N-(4-Trifluoromethoxy-phenyl)-propane-1,2-diamine was prepared as follows: [1-Methyl-2-(4-trifluoromethoxy-phenylamino)-ethyl]-carbamic acid tert-butyl ester was dissolved in 50% TFA/DCM for 3 hours. The reaction was worked up by stripping off the volatiles and ethyl acetate was added. The organic layer was then washed with sodium bicarbonate, dried over magnesium sulfate and stripped to dryness. The resulting compound
10 was then purified by flash chromatography.

Step C: (S,S)-{2-Cyclohexyl-1-[1-methyl-2-(4-trifluoromethoxy-phenylamino)-ethylcarbamoyl]-ethyl}-carbamic acid benzyl ester: (S)-N-(4-trifluoromethoxy-phenyl)-propane-1,2-diamine (76.7 mg, 0.328 mmol), (S)-2-benzyloxycarbonylamino-3-cyclohexyl-propionic acid (100 mg, 0.328 mmol) and HATU (125 mg, 0.328 mmol) were added to a
15 round bottom flask with 20 mL of dry DCM. DIPEA (127 mg, 0.982 mmol) was added dropwise over three minutes with vigorous stirring. The resulting slurry was stirred for 1.5 hours. The solution was then washed with sodium bicarbonate, the organic layer was separated and partially concentrated and the concentrate was purified by flash chromatography. Yield 138 mg, 81%.

20 **Step D:** (S,S)-2-Amino-3-cyclohexyl-N-[1-methyl-2-(4-trifluoromethoxy-phenylamino)-ethyl]-propionamide: The product from step C (138 mg, 0.265 mmol) and 5 mol% of 10% palladium on carbon (14 mg) was dissolved in 20 mL of methanol and purged with nitrogen. Balloon pressure of hydrogen was added and the resulting slurry was stirred for 5 hours. The septum was removed and the slurry was filtered through celite and concentrated. Yield 98
25 mg, quantitative.

Step E: The product from step D (15.4 mg, 39.7 μmol) was added to a flask with DMAP (14.5 mg, 0.119 mmol) and dry DMF (0.5 mL). 3-Chloro-benzenesulfonyl chloride (8.37 mg, 39.7 μmol) was added as a solution in 0.5 mL of dry DMF dropwise over 3 minutes. The resulting solution was stirred for 12 hours and the volatiles were stripped off. The solids
30 were taken up in methanol and purified by prep HPLC. Yield 15mg, 67%. ¹H NMR (CDCl₃) δ (ppm): 7.9 (s, 1H), 7.75 (d, *J* = 7.9Hz, 1H), 7.6 (d, *J* = 8Hz, 1H), 7.5(t, *J* = 7.9Hz, 1H), 7.05 (d, *J* = 8.3Hz, 2H), 6.6 (d, *J* = 8.9Hz, 2H), 6.15 (s, 1H), 5.1 (s, 1H), 4.1 (m, 1H), 3.65

Step E: The conjugate from step D (25.4 mg, 65.5 μmol) and 4-nitrophenyl tetrahydropyran-4-yl carbonate (19.3 mg, 72.1 μmol) were placed in a vial and 1.0 mL of dry DMF was added through a septum by syringe. B. Assays for Cathepsin Inhibitory Activity

5 Cathepsin S

[0402] The optimal substrate for cathepsin S, acetyl-histidine-proline-valine-lysine-amino carbamoyl coumarin, was identified from screening a combinatorial library of fluorogenic peptide substrates (Harris, J. L., B. J. Backes, *et al.*, *Proc Natl Acad Sci U S A* **2000**, 97(14), 7754-9). Kinetic measurements are performed in a total reaction volume of 30 µl in 384-well
10 microtiter plates. Cathepsin S, at a final concentration of 0.3-3 nM (active site), is incubated with the compounds at twelve varying concentrations in a buffer containing 100mM NaAc (pH5.5), 1mM EDTA, 100mM NaCl, 0.01% Brij-35 for 20 minutes at room temperature. Control reactions in the absence of inhibitor are performed in replicates of 24. The reactions are initiated by adding the substrate, acetyl-histidine-proline-valine-lysine-amino carbamoyl
15 coumarin, to a final concentration of 50 µM. The rate of substrate hydrolysis is measured by monitoring the increase in fluorescence at an excitation wavelength of 380nm and an emission wavelength of 450 nm that results from cleavage of the aniline bond in the substrate by the enzyme. The apparent inhibition constants for the compounds are determined from the enzyme progress curves (Kuzmic, P., K. C. Elrod, *et al.*, *Anal Biochem* **2000**, 286(1), 45-50)
20 and are then used to calculate the inhibition constants for competitive inhibitors.

Cathepsin K

[0403] The optimal substrate for cathepsin K, acetyl-lysine-histidine-proline-lysine-amino carbamoyl coumarin, was identified from screening a combinatorial library of fluorogenic peptide substrates (Harris, J. L., B. J. Backes, *et al.*, *Proc Natl Acad Sci U S A* **2000**, 97(14),
25 7754-9). Kinetic measurements are performed in a total reaction volume of 30 µl in 384-well microtiter plates. Cathepsin K, at a final concentration of 3.5 nM (active site), is incubated with the compounds at twelve varying concentrations in a buffer containing 100mM NaAc (pH5.5), 1mM EDTA, 100mM NaCl, 0.01% Brij-35 for 20 minutes at room temperature. Control reactions in the absence of inhibitor are performed in replicates of 24. The reactions
30 are initiated by adding the substrate, acetyl-lysine-histidine-proline-lysine-amino carbamoyl coumarin, to a final concentration of 40 µM. The rate of substrate hydrolysis is measured by

monitoring the increase in fluorescence at an excitation wavelength of 380nm and an emission wavelength of 450 nm that results from cleavage of the aniline bond in the substrate by the enzyme. The apparent inhibition constants for the compounds are determined from the enzyme progress curves (Kuzmic, P., K. C. Elrod, *et al.*, *Anal Biochem* **2000**, 286(1), 45-50) and are then used to calculate the inhibition constants for competitive inhibitors.

Cathepsin L

[0404] The optimal substrate for cathepsin L, acetyl-histidine-lysine-phenylalanine-lysine-amino carbamoyl coumarin, was identified from screening a combinatorial library of fluorogenic peptide substrates (Harris, J. L., B. J. Backes, *et al.*, *Proc Natl Acad Sci U S A* **2000**, 97(14), 7754-9). Kinetic measurements are performed in a total reaction volume of 30 µl in 384-well microtiter plates. Cathepsin L, at a final concentration of 0.1 nM (active site), is incubated with the compounds at twelve varying concentrations in a buffer containing 100mM NaAc (pH5.5), 1mM EDTA, 100mM NaCl, 0.01% Brij-35 for 20 minutes at room temperature. Control reactions in the absence of inhibitor are performed in replicates of 24. The reactions are initiated by adding the substrate, acetyl-histidine-lysine-phenylalanine-lysine-amino carbamoyl coumarin, to a final concentration of 20 µM. The rate of substrate hydrolysis is measured by monitoring the increase in fluorescence at an excitation wavelength of 380nm and an emission wavelength of 450 nm that results from cleavage of the aniline bond in the substrate by the enzyme. The apparent inhibition constants for the compounds are determined from the enzyme progress curves (Kuzmic, P., K. C. Elrod, *et al.*, *Anal Biochem* **2000**, 286(1), 45-50) and are then used to calculate the inhibition constants for competitive inhibitors.

Cathepsin B

[0405] The optimal substrate for cathepsin B, acetyl-histidine-proline-valine-lysine-amino carbamoyl coumarin, was identified from screening a combinatorial library of fluorogenic peptide substrates (Harris, J. L., B. J. Backes, *et al.*, *Proc Natl Acad Sci U S A* **2000**, 97(14), 7754-9). Kinetic measurements are performed in a total reaction volume of 30 µl in 384-well microtiter plates. Cathepsin B, at a final concentration of 1.5 nM (active site), is incubated with the compounds at twelve varying concentrations in a buffer containing 100mM NaAc (pH5.5), 1mM EDTA, 100mM NaCl, 0.01% Brij-35 for 20 minutes at room temperature. Control reactions in the absence of inhibitor are performed in replicates of 24. The reactions are initiated by adding the substrate, acetyl-histidine-proline-valine-lysine-amino carbamoyl

coumarin, to a final concentration of 10 μ M. The rate of substrate hydrolysis is measured by monitoring the increase in fluorescence at an excitation wavelength of 380nm and an emission wavelength of 450 nm that results from cleavage of the aniline bond in the substrate by the enzyme. The apparent inhibition constants for the compounds are determined from the enzyme progress curves (Kuzmic, P., K. C. Elrod, *et al.*, *Anal Biochem* **2000**, 286(1), 45-50) and are then used to calculate the inhibition constants for competitive inhibitors.

[0406] Preferred cathepsin S inhibition constants for compounds of the present invention are less than 10 μ M. More preferred inhibition constants for compounds of the present invention are less than 1.0 μ M. Most preferred inhibition constants for compounds of the present invention are less than 0.1 μ M.

[0407] Selectivity for cathepsin S in the presence of cathepsin isozymes was determined by the ratio of the cathepsin isozyme inhibition constant of a compound of the present invention to the cathepsin S inhibition constant of the same compound. Preferred compounds of the present invention selective for cathepsin S have ratios of greater than 10. More preferred compounds of the present invention selective for cathepsin S have ratios of greater than 100. Most preferred compounds of the present invention selective for cathepsin S have ratios of greater than 1000.
